

DEADLINE OF SUBMISSION:- 25TH SEPTEMBER, 2025 6:00 AM

DESIGN BRIEF:-

Background :

The firm is developing a next-generation Data Platform to empower investment professionals, analysts, and researchers with tools to seamlessly transform ideas into structured financial models that help them visualize, evaluate, and test strategies and scenarios, and provide insights.

The platform aims to support users with varying levels of technical expertise, from those who prefer intuitive, interactive interfaces to those who customize models with advanced methods. The platform will offer an integrated suite of products, enabling users to construct financial models and seamlessly generate interactive dashboards and collaborative reports.

The goal is to create an environment which enables users with different skill levels to :

- Translate ideas into concrete financial models by combining internal/market data, formulas, arithmetic operations. existing analysis, logic etc.
- Share models and outputs easily across teams with controlled permissions.
- Reuse and adapt templates or prebuilt model elements for faster experimentation.
- Explore how different interfaces whether visual, code-based, or hybrid, can make modelling accessible.

Ultimately, the platform aims to bridge the gap between data, modeling, and business decisions, enabling faster experimentation, deeper analysis, and stronger collaboration.

Problem Statement : Design a desktop-first Data Platform interface that enables users to:

- Build and manage financial models using interfaces that work for both non-technical and advanced users.
- Interactively design, edit, and visualize model structures (Think beyond text/code-only approaches).
- Access and reuse templates, prebuilt components, or shared models contributed by others.
- Build interactive dashboards and reports and share with teammates while managing permissions and version history.

- Explore how AI could support model-building, validation, or reporting.

Deliverables :_Your submission can include **(but is not limited to)**:

- Stakeholder Understanding: Who the users are and their core needs.
- Ideas and Assumptions: Design principles, hypotheses, or constraints.
- Storyboards, Sketches, or Workflows: Illustrating how users would move through the system.
- Wireframes and High-Fidelity Mock-ups: Key screens, interactions, and layouts.
- Optional Prototype: If time permits, a clickable prototype to demonstrate core interactions.

Submission :

- **Format - Single PDF file (maximum 15 MB). Do not send zip files.**
- **File naming Convention - First Name_Last Name**
